EXPLAINS THE ELMIRA SYSTEM.

Mr. S. W. Travers Tells of the Morton Process - Superintendent Bolling Makes a Report and Answers Some Criticisms.

The Council Committee on Water held an extra session at the City Hall last night to hear a statement that Professor J. Rufus Hunter, of Richmond College, had promised to make concerning the Elmira system of filtration, in which the committee is particularly interested. They were by no means disappointed at what Dr. Hunter had to say, for his statement was very complete, and he was able to answer all questions that were put to him by members of the committee and others who were present at the meeting, including Mr. S. W. Travers, president of the Chamber of Commerce, and President Turpin, of the Board of Aldermen. Mr. Travers submitted to the committee prints and a prospectus concerning the Morton process, of which he had heard during his recent visit to Boston, and Superintendent Bolling submitted a report, which was in part an answer to the attacks recently made upon the qualities of the Richmond water.

DETAILS OF THE SESSION.

The members of the committee presen The members of the committee present were Messrs. Tanner (chairman), Whalen, Mills, Cutchins, Pergusson, and Winston. An application for the use of the New pump-house one day next week for the purposes of a picnic, to be held by colored people, was rejected. It was the sense of the committee that the pump-houses should not be rented at any time to colored people.

ored people.

A resolution that water should be supplied at Camp Lee for the use of the Third and Second regiments was adopted, and the Superintendent was instructed to leave the water turned on, pending the action of the City Council on the resolution.

DR. HUNTER ON FILTRATION. DR. HUNTER ON FILTRATION.

Mr. Tanner then introduced Dr. Hunter, of Richmond College, who, he said, had kindly consented to give the committee the benefit of his investigations and researches at Boston and Elmira. In the former city, said Dr. Hunter, he had consulted Professor W. Mason, of the Troy Polytechnic Institute, an eminent authority on matters of filtration. In the course of a conversation the Professor had stated that there were two systems—the Old-World system, by means of filterbeds, and the mechanical system. The capacity of the first is 2,500,000 gallons per acre a day, which was impracticable here by reason of the expense of construction.

In connection with the proposition of the New York Filter Company, recently submitted to the committee, Professor Mason recommended that the city should

sible.
On recommendation of Professor Mason, he had visited Elmira, where the system in vogue is filtering by coagulant. The water of Elmira is not as muddy as that of Richmond. The plant filters about 5,000,000 gallons a day. There are eighteen filters connected by batteries, so that any one can be shut off without interfering with the others. The alum differs from the ordinary sort. Experiment has shown it to be the best, because it leaves no potassium sulphate in the water.

THE PROCESS DESCRIBED. THE PROCESS DESCRIBED.

THE PROCESS DESCRIBED.

The alum is admitted into the water outside the tank, and passes into the settling basin. It requires about 29 minutes before the water enters the filterbed. The water circulates, and stirs the coagulant so that it collects about 70 per cent, of the mud in the water. After it has so circulated the water passes into the filter-bed proper, entering through a pipe which passes through the sand. The water then filters through 3 feet of fine sand and is drained off to the reservoir, Professor Hunter spoke at some length Sand and is drained off to the reservoir.

Professor Hunter spoke at some length
of the action of the coagulant, and said
the plant at Elmira does not leave any
alum in the solution. When the water
was very muddy more alum was used. It
was an easy matter to test so that not
too winch alum should be used. NO ALUM IS LEFT.

NO ALUM IS LEFT.

One grain of alum per gallon is all that is used, and the plant removes all the alum from the water. A chemist is employed by the Water-Works Company at Elmira, and the results of his analyses is shown in an interesting report. The report for the month of August shows that an average of 268-10 of the bacteria originally in the water were removed by this system. The lowest percentage was 33 per cent., and the highest 23-2-10 per cent. The highest quality of alum used was 14-10 grains per gallon; the average is 65-100ths.

alum on iron pipes by which it would conducted to the houses, Professounter said that the humic acids would e largely removed by contact with the luminum, and would be greatly im-

proved.

In reply to Mr. Boiling, Professor Hunter said the Elmira plant had two tanks over and above those required for the average daily consumption, with a rapacity of 500,600 gallons.

The Elmira process of filtration removes albumenoid ammonia to a very large exent. There are chemical changes as well as mechanical, tending to purify the water and make it more palatable. It removes the oxygen to some slight extent. ter and make it more palatable. It removes the oxygen to some slight extent, but when the water is emptided into the reservoir it can be aerated, and the oxygen in the water is about the same when it gets into the reservoir as when it gets into the reservoir as when it first enters the filter. It is easy to reaerate the water. At Elmira the water does not taste flat, and it presents a beautiful appearance. The object of the filters at Elmira was to remove the bacteria. There is little mud there. The filters are washed about twice a day when the water is very muddy, but as a rule once a day.

CONTAMINATION OF WATER.

The water, Professor Hunter said, would

CONTAMINATION OF WATER.

The water, Professor Hunter said, would be contaminated in about five days. With the large storage capacity here, and the fact that the daily use is eight and a half million gallons a day, or about one-sixth of the storage capacity, that was not a very material consideration. The sand has to be replaced one inch a year. The same general system as is in operation at Elmira is being put in at Wilkesbarre, Pa., where the daily consumption is from eight to ten million gallons a day.

Professor Hunter described the washing of the sand in the Elmira filters, and said that the sand was only discolored for 2 or 3 inches, the rest was perfectly white.

Mr. S. W. Travers asked if Professor Hunter thought the Elmira plant, which is designed to clear the water of bacteria, would be efficacious in removing the mud from our water. Professor Hunter said he thought it certainly would. Experiments on water were necessary, and he thought the Council should make arrangements for such experiments, chemical and bacteriological.

Replying to Mr. Turpin, Professor Hunter said he was of the opinion that the

line of Victorias, Surreys, Phaetens, Traps, Buggies, Boulevards, and Runa-bouts; also a large stock of Delivery Wagons, for dry-goods, groceries, shoe-stores, and Milk-Wagons; also, a large lot of Second-Hand Vehicles.
All of these Vehicles will be sold AT COST, so as to settle up our business

teriological.

Replying to Mr. Turpin, Professor Hunter said he was of the opinion that the percentage of alum to be used to clear Richmond water of the mud would not have to be greatly increased.

TO WHOM IT MAY CONCERN:

THE PARTNERSHIP OF PLEASANTS & CRENSHAW. No. 1100½ east Main street, Richmond, Va., composed of the undersigned as partners, expired and was dissolved on the 1st day of August, 1898, by limitation. Ivey L. Arrington, at the above address, has been appointed by us attorney in fact to wind up the business of the old firm, and as such he alone is entitled to collect and receipt for all moneys due the said late firm and to him all bills against said late firm should be presented for payment.

ARTHUR L. PLEASANTS, CHARLES S. CRENSHAW. have to be greatly increased.

ON THE RIGHT LINE.

Mr. Travers congratulated the committee on taking this matter up. He urged the committee to be cautious, but said he thought we were at last upon the right track. He presented diagrams and outlines of the Morton process of sand filtration by upward flow, concerning which ne had learned something during his recent visit to Boston. He did not endorse it, but thought he would lay it before the committee, for them to take such action as they saw fit.

NOT READY TO REPORT.

NOT READY TO REPORT.

Superintendent Bolling submitted the following report, made by himself and Colonel Cutshaw to the City Council:

To the Committee on Water:
Gentlemen.—I beg to submit the following recommendation to your committee, which is the same made to the City Council by Colonel Cutshaw, City Engineer, and myself, in response to a resolution from that body:

"We beg to say that from our experiments and present information on the methods of filtration of water, either by prepared sand-beds or mechanical filtration with the use of coagulants, we are not now prepared to report a plan for its application to our James-river water; and the proposed methods of sedimentation having been severely criticised, we ask to be allowed to carry out a system of experiments and analysis, as will abso-

# 

HOW SUPPLY IS OBTAINED.

The question of furnishing the people of Richmond with clear water has been a subject uppermost in the minds of many in the last few weeks, when the water was very muddy and unsightly for a much longer period than for some years, and there have been several letters in the papers from men of prominence which deserve some notice, and as some have criticised the present method of furnishing water, I think it but right to explain how our supply is obtained, and whether any examinations have been made to find out whether our water is healthy or liable to cause slekness. Richmond is divided, in her water supply, into two districts. The New Reservoir supplies the upper or higher district, covering about four fifths of its area; the Old Reservoir, the lower, about one fifth of the area. The New Reservoir is filled with water taken from the canal or forebay at the New Pump-House, the Old Reservoir from the river at the foot of Hollywood. The canal extends from a short distance above Bosher's Dam to the pump-house, a distance of six and a half miles. The quantity of water taken from the river about the dam each twenty-four hours amounts to 27,439,260 gallons. Several small streams flow into the canal, between Bosher's Dam and the pump-house, a mounting in volume to 10,828,830 gallons, or about 37-40 per cent. of the whole volume. The velocity of the water in the canal is a mile per hour; therefore, it is in no sense stagnant. Twice in its flow to the pumps it passes through gates, where one surface is higher than the other, and is tossed about and whirled around, receiving the same kind of aeration it would get in tumbling over the rocks in the river bed. Except in cases of freshets in the river, the water in the canal taken in above Bosher's Dam would reach the pump-house, and that of the river-are few and far between, and wholesome water. Comparative examinations of water taken from the forebay or canal at the pump-house, and that of the river-are few and far between, and sidning water, and her beau summer and summer b

COAL, WOOD, AND COKE.

The object of this suit is to obtain the direction, guidance, and protection of the court for the executors in the administration and settlement by them of the estate of their testatrix, the late Elizabeh C. Waller, and to ascertain the debts and claims against the said estate, if any, in order that there may be paid to the several residuary legatees the residuum of the estate without requiring relunding bonds, and the accounts of the executors finally settled.

And affidavit having been made and filed that the defendant, Rebecca Nolan, is a non-resident of the State of Virginia, if is ordered that she appear here within fifteen days after the due publication of this order and do what is necessary to protect her interests in this suit.
